

ABSTRACT

[0027] Windshield support assemblies which support a windshield during replacement of a windshield of a vehicle are disclosed, as well as a method for using such windshield support assemblies. Each of the windshield support assemblies has a support member and a self-tapping screw which permits the windshield support assembly to be connected to a frame of the vehicle at a position adjacent a lower end of a windshield to be replaced. Thus, the windshield support assemblies are positioned to support a new windshield during installation of the new windshield.
